

NUOVA TORNADO is the ideal equipment for sanitizing the pipes of civil or automotive air conditioning. The exclusive dispensing gun, which allows the detergent to mix with the air, is capable of produce very small particles, about 8 microns diameter (compared to 3 microns of cigarette smoke particles). The size reached by the sprayed product allows the evaporation of a very high fraction of the dispensed product, which therefore passes from the liquid to the gaseous state. In a minute about 30g of specific sanitizing product are dispensed.

For this operation, the atomized spray exiting the dispensing gun must be addressed in the outlet or recirculation vents, thus allowing the product to reach and saturate all of the pipes and compartments that make up the air side of the air conditioning system itself. The low delivery pressure avoids the risk of mechanical damage that could arise with the introduction of violent spray of compressed air. The distribution of detergents guarantees a prolonged and widespread permanence of the product in the air of the treated environment to reach and sanitize all the surrounding surfaces.

The easy access to the internal components of the machine allows a fast recharge of the tank product. 8 m power cable and 2 m spiral dispenser cable.
